How do you ensure that your business goals and strategy is supported by your information infrastructure? Aligning information technology assets to stay ahead of the ever changing business landscape is never an easy task. Independent studies have demonstrated that a typical global 1000 organization spends in excess of 9% of their yearly revenues on acquiring, assembling, integrating, distributing and analyzing data. With the amount of data growing exponentially each year, the burden of managing information in order to achieve a competitive advantage becomes even greater. The inability to manage information in a timely and effective manner can inhibit the decision making process, result in a loss of productivity, effectiveness and cause a higher total cost of ownership. Can your organization afford the opportunity cost of not investing in better management of your information infrastructure?

About Us
Epilogic is a solutions firm that specializes in the Intelligence Supply Chain, which consists of the movement and delivery of intelligence within the organization. We focus on the aggregation of data and information in order to facilitate better business decisions. Our team has designed and developed enterprise wide data warehousing solutions for some of the largest companies in the world with some of the largest database as well as the most complex metrics.

With an emphasis on the management of Intelligence, we help our clients gain a competitive advantage by leveraging critical business data and turning it into actionable intelligence for executive decision making. Our focus is on data warehousing, business intelligence and knowledge management solutions that are manageable, scalable, and flexible. Utilizing a strong project methodology we help our clients to achieve unparalleled success, lower total cost of ownership and make better business decisions.

Approach
We approach the management of intelligence by focusing on the user within the organization that needs to make Business Decisions. By taking a customer centric approach we strive to hide the complexity of the corporate infrastructure while provide a single place for accessing all of the intelligence necessary in order to get the answers to the business questions needed to make managerial decisions. By aggregating all of the intelligence into a single point of entry or analytic portal, which we call an InfoShop, we can reduce the cost of acquiring information and improve productivity. Our methodology, while simplifying user access, has a robust distributed approach to processing data through the Intelligence Supply Chain. By addressing the gaps in traditional projects, we can help improve the efficiency and effectiveness of your information infrastructure.
